PITCH DECK · MADE TO MOVE

Sidekey

Your wallet is the master. Everyone else gets a policy.

PITCH STEP 01 / 04

Safe convenience

Keep it secret, keep it safe!

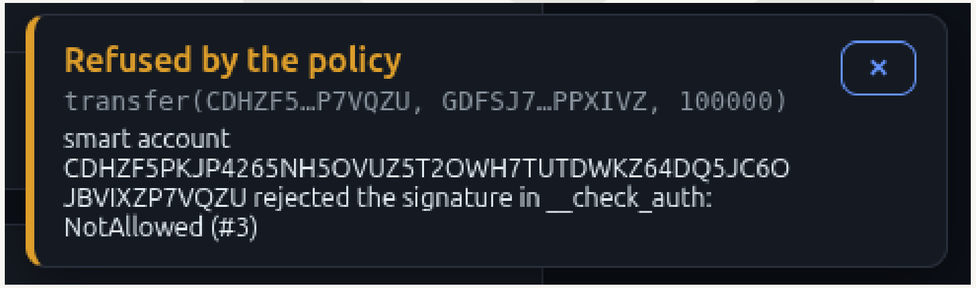

- Your hardware wallet keeps your funds protected and safe
  So why take it out every time you need to make a routine transaction?
- With Sidekey, your hardware wallet can stay safely stored. You decide which interactions are allowed with just your phone.
  Anyhing else? Not allowed!

A passkey may call claim() on a yield emitting contract

You allowed it!

Transfer? Not allowed!

PITCH STEP 02 / 04

PMF

Every day, thousands of kittens are injured because people drop their hardware wallet on them during routine transactions..

- Well, potentially. I didn’t research that. But it could be!
- It solves an inconvenience, and promotes safety*

👉 **Why you should care?** Policy signers are in the spotlight with x402, but don’t neglect their potential for ‘human accounts’. It allows for convenience improvements like this, but can for example also limit how much you(r kids) can spend on silly games.

* Testnet demo implementation only. Do not use on mainnet. Do not use with real funds

PITCH STEP 03 / 04

TECHNICAL WORKFLOW

Under the hood

- Create a smart account, with your G.. account as master signer
- Add passkey signers in policies that are explicit in which contract, function and arguments they can authorise
- Anything not explicitly allowed still needs the full (hardware) G.. signer
- (Ab)use wallets signMessage methods until AuthEntries can be signed by hardware-compatible wallets

PITCH STEP 04 / 04

NO TEAM

Robert

Also Robert, the picture you usually see.

Just me

- Robert a.k.a Row-Bear
- Stellar Quester, RPCieger, tinkerer, community member
- No formal education or experience in development, but over the years I've picked up enough to make and break some things

Github Copilot did most of the legwork really

👉 This was great fun
